MAKE £100-£200 PER
DAY ROULETTE
SYSTEM

THIS IS MY PERSONAL, ROULETTE SYSTEM I USE TO MAKE £100-£200 PER DAY. I PLAY FOR ON AVERAGE 1 TO 2 HOURS A DAY USING £50 PER POINT AS A STAKE AND A £10,000 BETTING BANK, AS YOU CAN SEE FROM THE CHART BELOW THIS SHOULD AVERAGE YOU £175 PER DAY. I WOULD ADVISE YOU TO SET YOUR BANK OUT WITH 100 TIMES YOUR UNIT STAKE I.E £2 PER POINT £200 BETTING BANK AND WHEN YOU HAVE REACHED YOUR PROFIT FOR THE DAY (3 POINTS) STOP AND START AGAIN THE NEXT DAY. START WITH A SMALL BANK AND WHEN THIS DOUBLES, DOUBLE YOUR STAKES.

SYSTEM MAKES 3 PTS PROFIT
PER HOUR PLAYED (these are
averages, sometimes you'll make
more - quicker, some times you'll
make less - slower)

£1 A POINT = £3 PER HOUR
£5 A POINT = £15 PER HOUR
£10 A POINT = £30 PER HOUR
£50 A POINT = £150 PER HOUR
£100 A POINT = £300 PER HOUR

RULES

1. Bet on either:
 - Black or Red
 - Odds or Even
 - 1-18 or 19-36
2. Bet the same amount every time
3. Bet on the same outcome every time
4. Only bet one hundredth of your total pot. So if you want to bet \$2.00 each time make sure you have at least \$200 in your bank.
5. PERSIST, you might be in loss for ages but if you keep going it is certain that you will eventually come out on top, before you run out of cash.
6. Walk away when you have made a few units profit. 3 units is my marker, so if I am betting \$2.00, I stop when I get to \$6.00.

Please make sure you read this over several times before you start and use the exact links to to get your bonus, it is a simple system but as with all systems must be followed to the letter.

EXPLANATION

Quite simply we use the fact that when starting to bet it is virtually impossible that one outcome can happen 10's of times in a row

And

If we stick to one outcome using level stakes, it will put use in profit at sometime over a long period time

Let me put it this way

We bet on 1 of 2 outcomes and keep on betting with level stakes until this outcome puts use on top – Then we stop.

What I am saying here is that if you where to flick a coin 100 times do you think it would really be feasible to ALWAYS have more heads than tails or via versa?

Yes, it is possible, but over time there must be a period when there has been more tails than heads. Its cold - solid mathematics.

In the 200 test runs we did of 100 runs of a roulette wheel (20,000 spins of the roulette wheel) - before putting this system into practise NEVER was one outcome purely ahead of the other i.e. 100% potential win rate!

But what you have to remember is that it would take far, far more than 100 spins for you to lose all your money unless 100 spins in a row landed on the outcome you weren't betting on.

The chance of this happening is about 1 in 1,267,650 trillion. Trillion.

Example:

The simple fact is that if I tossed a coin 100 times on average I would get 50 heads and 50 tails, sometimes the split will be 51/49 or 59/41. The example below illustrates exactly why you'll always eventually win:

John and Fred are playing a game. Fred will toss the coin and John will bet on the result of the outcome. Whatever John loses Fred wins.

John bets £1 on heads. Fred tosses the coin and it lands on tails.

Fred wins £1. John loses £1

John then bets again £1 on heads. Fred tosses the coin and it lands on tails again. Fred wins £1. John loses £1.

John then bets again £1 on heads. Fred tosses the coin and it lands on heads. Fred loses £1. John wins £1.

At this point John is down £1 and Fred is up £1. At the beginning it was £0 each. If John keeps playing eventually he will have more money than Fred. If they kept playing for several hours. The likelihood is that they would oscillate being up and down i.e. Fred would be in profit for a while, then John would be in profit for a while, then Fred, then John etc.

Using our technique we are playing this same game with the bank. Sometimes the bank will be winning sometimes we will be winning. The point is we get ahead we cash out, and the next day we start again. You can also open up another casino once you've reached your x3 unit stake.

[For loads more casinos to use with this system Click Here](#)

You do not need to worry if you are down... In these ideas lies an inherent tedium which sometimes arises, because it sometimes takes a while for use to be in profit. I have played roulette for half an hour just to make £3. You must persist knowing that eventually you will break even and eventually you will be in profit. I once sat down to play and my bet was on black, the first spin was red and the following eight consecutive spins were red! So starting with a pot 100 I was straight away at 91, but I kept going with my bet and I started to land on black, and after a while I got in profit and walked away with money in the bank.

The reason we have such a large pot for such small bets is to reduce the possibility of running out of money. If your pot is 100 times your bet the chances of you running out are unbelievably tiny. Think about the chances of tossing a coin 100 times and

getting 100 heads! The odds are actually astounding: 1 in 1,267,650 trillion, trillion. (0.5^{100}). The actual odds of you running out are larger than this because you would not have to lose everything in a row, but suffice to say they are still tiny. Working the odds out would be unbelievably complicated.

It is ok if you start with a small pot and work your way up, because once you get to a large pot of say £2,000. you can make decent money per hour.

Conclusion

This is 'Cold – Hard mathematics', start with a betting bank of £200 and keep on betting on either red or black until you are on top by £3, this may take you minutes or it may take you hours but it should happen and when it does you should walk away.

“YOU WON'T NEED LUCK ANYMORE!”
